FREZINSKIY, I.L.

AUTHOR: Frezinskiy, I.L.

TITLE: Mechanization of Intra-Plant Planning (Mekhanizatsiya vnutrizavodskogo planirovaniya)

PERIODICAL: Avtomobil'naya Promyshlennost', 1958, Nr 3, pp 1-4 (USSR)

ABSTRACT: In the automobile plants, 16% of all labor is employed in the management of the enterprise. Many plants use computers for internal planning, production calculation, accounting and normative purposes, for the compilation of technical documents, etc. In the Gor'kovskiy avtozavod (Gor'kiy Automobile Plant), since 1938, the production program has been worked out by computers. Guide-cards are printed for all automobiles, spare parts, and other production units of the plant; these receive a special number; the so-called "number of position". For each detail in the number of position, a special perforated card is used, containing the number of the detail, the supplier, the producer, the consumer, the number of position and the quantity. This method of planning has several drawbacks. In the Gor'kiy Plant only the quarter plan was calculated in this way and the month plans were deducted from the quarter plan by hand. The possibilities of a complex mechanization of price, work, and material cal-

Card 1/3

Mechanization of Intra-Plant Planning

113-58-3-1/16

culations were not fully used. In the Moscow Plant of Small-Displacement Automobiles the experience of the Gor'kiy Automobile Plant has been improved. For every workshop, 3 programs are worked out: the supply plan, containing all products made by the workshop and delivered to various consumers; the reception plan, containing all parts, intermediate products and assembly material needed by the workshop; the manufacturing plan, containing all parts being processed or assembled in the workshop. A form for these plans is given in Table 1. Corrections are introduced in case of constructive or technological changes (Table 2). If the aim of the plan is not reached, the deficit is added to the plan of the next month. If the production is greater than planned, the surplus is deducted from the next month. Controls are effected in different ways. In the serial sections, production is controlled before the beginning of the production cycle. In the continuous operation lines, production plans are controlled by taking inventories of different parts of the details every day. The initial data of the plan, in regards to man hours, are computed to a production value of 1,000 rubels, as well as to a certain quantity of spare parts, in order to determine the percentage of wages in pro-

Card 2/3

Mechanization of Intra-Plant Planning

113-58-3-1/16

duction. The data necessary for compiling and changing the perforated cards are sent by the production-dispatcher department, to the computing station in the form of a special document (Table 7). The mechanization of internal planning is only the beginning of the complex use of computing machines in the mechanization of plant management. There are 8 tables.

TITLE: Design of input filters for automatic potentiometers

SOURCE: IVUZ. Priborostroyeniye, v. 8, no. 4, 1965, 21-24

TOPIC TAGS: potentiometer, electronic measurement, servosystem, voltage stabilization

ABSTRACT: It was shown by G. R. Jacob ("Dynamics of Electronic Self-Balancing Systems", *AIEE Trans.*, Vol 76, part I, No 5, 1957) that the input filter for eliminating interference in automatic potentiometers has a stabilizing effect on the servosystem. Therefore, the resistance and capacitance of the filter should be chosen so that the dynamic properties of the servosystem are improved while the interference is eliminated. The authors discuss this problem briefly, since it has not been taken into consideration in the design of Soviet instruments. A specific example of filter design is given for the EPP-09 potentiometer. Orig. art. has: 2 figures, 4 formulas.

TITLE: Controlling the temperature coefficient of resistance (TCR) of conducting polymer materials

SOURCE: Ref. zh. Elektrotehnika i energetika, Abs. 5B13

REF SOURCE: Nauchno-issled. tr. Vses. n.-i. in-t plenok i iskusstv. kozhi. sb. 16, 1965, 135-148

TOPIC TAGS: semiconductor polymer, rubber, ~~polymer~~, plastic base polymer, *filler*

ABSTRACT: Specimens of rubber-base polymers with a conducting filler and with embedded contacts were heated in a thermostat or by passing a current up to a maximum temperature determined by the polymer characteristics. After the first cycle of heating and cooling, the initial electric resistivity abruptly fell off. After 3--4 cycles, the electrical properties became stabilized. The effect of mollifiers on the TCR of polymers was investigated. Ten parts by weight of mollifier were added to 100 parts of the polymer. The TCR was negative when dibutyl phthalate and vaseline were added; it was positive when rubrax was added. The amount of rosin (as a mollifier) should not exceed 15-17 parts by weight per 100 parts of the polymer; otherwise, the physico-mechanical and electrical properties of polymer are impaired. The tested polymer rubber-base compositions have a TCR near zero within 40--100C.

Card 1/2

UDC:621.315.5

ACC NR: AR6028418

Their electrical properties can be stabilized by a preheating whose duration depends on the type of rubber used. Also, the properties of conducting polymer plastic-base compositions were investigated. These compositions do not require additional thermal treatment. The above tests showed that the TCR considerably depends on the regularity of molecular structure of the source polymer. The TCR can be controlled by adding mollifiers and by proportioning polymer compositions. Ten figures. Bibliography of 10 titles. V. Brezinskiy [Translation of abstract]

High-Speed Regulator for Wattless Power "VUS - 0.98" (Czechoslovak Patent No. 90955)

gulator has normally 10 stages, the number of which can be varied according to local requirements. This regulating system employs no additional power source and guarantees proper operation even under aggravated conditions (unequal loading of phases). Its time delay is adjusted so that short fluctuations of the wattless-power characteristic are not registered. The control element is switched into the circuit of the measuring transformers and to the terminals of the bus bars, or the voltage measuring transformer (Diagram 3). The following technical data are given: Rated voltage: 3 x 380, or 3 x 300 v, 50 cps; rated current: 5 amp; auxiliary voltage 220 v a-c; time delay of one stage: 0.1 sec, or arbitrarily through timing relay; internal consumption of the voltage unit: approximately 30 va/3 w; internal consumption of the current unit: 6 w; permissible current for contact making and breaking of the connector coil: 10 amp/5 amp a-c. In conclusion, the author states that the equipment described is delivered by the "Pokrok" Cooperative in Zilina, but can be assembled by nearly every plant (as done by the "Matador", "Hydrostav", and other Bratislava plants). There are 2 photos and 1 figure.

TITLE: Chromatography of leaf pigments on thin layers of silica gel, and an
improvement of quantitative evaluation of chromatograms on thin layers

SOURCE: Biologia, no. 11, 1964, 820-826

TOPIC TAGS: silica gel, chromatographic analysis, plant physiology

ABSTRACT: A method of thin layer chromatography of assimilatory pigments on silica gel is described. Silica gel was prepared by the authors from water glass. An improvement of the composition of the layer, a new method of elution of the pigment spots accelerating the transfer of the pigment into the eluent, and other modifications suggested by the authors are described. The method allows quantitative separation of chlorophyll a, b, pheophytin a, lutein, neoxanthin,

PERIODICAL: Chemické Listy, 1958, Vol 52(82), Nr 10, pp 2000-2003
(Czechoslovakia)
ABSTRACT: The experimental determination of light scattering values
of certain dextran fractions are carried out. The
results of a series of determinations and those reported
by others are discussed and some suggestions are made
for the divergences such as unhomogeneity of fractions
and incomplete mixing.
There are 2 tables, 2 figures and 4 references, 2 of
which are Czech, 2 Western.

TITLE:

Electroconductive Coatings on Glass

PERIODICAL:

Steklo i keramika, 1959, Nr 11, pp 43-44 (USSR)

ABSTRACT:

One of the exhibits at the Czechoslovak Glass Show held in Moscow is a glass flask (see Figure) in which water boils continuously. This is one of the applications of electroconductive glass coatings. A number of Czechoslovak institutes are studying this phenomenon, but as yet the exact composition of the electroconductive layer is not known. In Czechoslovakia, the use of flat glass with an electroconductive layer is being studied. Such glass may be used as a source of infrared radiation, which is, however, difficult to realize at temperatures above 250°. Glass vessels covered with an electroconductive coating are at present used in laboratories only, since they require expert handling. There is 1 figure.

of the clinical picture, laboratory examinations focussed in particular on functional examinations of the small intestine, and X-ray examination. An important role in confirmation of the diagnosis is due to the histopathological examination of a portion of the intestinal mucosa. Treatment includes dietotherapy, substitution treatment, and the administration of corticotrophin and steroid hormones. Early treatment is important for the prognosis of the disease.

"Changes of Pancreatic Enzymes in the Blood After Intraduodenal Application of Ethylalcohol."

Prague, Casopis Lekaru Ceskych, Vol 102, No 46, 1963, pp 1268 - 1271

Abstract: (Authors' English summary) Duodenal application of ethanol increased activity of amylase and lipase in the blood of 75% of patients with chronic pancreatitis by more than 100% of the normal values. In the control group the activity was increased by a maximum of 80.5% for amylase and 83.5% for lipase. In chronic pancreatitis the extent of changes in the outflow system and the secretory capacity of the pancreas are probably decisive in disturbances of the secretion gradient and in increasing the release of the enzyme into the blood after the application of ethanol. 1 Figure, 3 Tables, 13 Western, 3 Czech, 3 Russian references.

"Lactate Dehydrogenase Isoenzymes of Jejunal Biopsies in Patients with Malabsorption Syndrome."

Prague, Casopis Lekaru Ceskych, Vol 105, No 32, 15 Aug 66, pp 860 - 864

Abstract [Authors' English summary modified]: A decrease of LDH5 and an increase in LDH4 and 3, and of H monomers of LDH is found in jejunal biopsies in adults with nontropical sprue, and in children with celiac disease. These changes may be used in diagnosis and in studies of heredity. 3 Figures, 1 Table, 19 Western, 7 Czech references. (Manuscript received Nov 65).

Abstract [Authors' English summary modified]: Beta-carotene and vitamin A were determined on fasting and 3 and 5 hours after administration of 5000 i.u. of vitamin A in an oil; 1,3 glycerol carried out on 55 patients. The average beta-carotene was 107 microgram %, of vitamin A 234 on fasting, and 581 and 1163 i.u. 3 and 5 hours after the loading of vitamin A. 2 Figures, 24 Western, 12 Czech references.

Title : Resonant System of the Magnatron.

Orig Pub : Slaboproudy obzor, 1956, 17, No 6, 305-309; No 7, 379-386

Abstract : The fundamental properties of the resonant system of the magnetron are derived from the point of view of its periodic structure. The author then indicates a method for approximate calculation and gives the resultant equations for the calculation of the resonant frequencies of certain types of resonant systems with the aid of field theory.
